**WEEKLY REPORT**

**Aysun BAŞÇETİNÇELİK:**

After talking with my friend who is a graduate from BÖTE, I learned a few names that are related to our project area in BÖTE. Yesterday, I went to talk with one of these people. His name is Kürşat Çağıltay, his main area is games for teaching. We talked about possible projects that we can make. He gave examples about his students' early works. He also advised using Renderware. Due to the lack of licenses, unfortunately we have not been able to use and understand it. I have also prepared a web site for our project. We will work on that site later.

**Çağıl ÖZTÜRK:**

This week I made some research on the Internet to find if there is a better subject to replace with our traffic project. I thought that dental education and orthodontic as its branch could be fine, gathered some information from my sister since she is a dentist. Looked the site of “Ankara diş hekimliği”: <http://www.dentistry.ankara.edu.tr/html/ortodonti.html>. I sited the plan but I did not have knowledge to estimate the burden of constructing 3D tooth and chin. Then I shared my idea with my group friends. They made estimations and however the subject was good we decided not to go on this subject.

**Mennan GÜDER:**

This week I looked for finding another subject. However all of the subjects that we found were too complex in terms of their simulation (that is not just my decision according to so many people including experts on 3D technologies). Also we do not have enough knowledge about them. For example one of them was dental application. As a result I decided that our current subject is the one that I want to do.
