MigroSoft, Weekly Progress Report #9

Since we had to make presentation last week, our main business was creating a clear demonstration of our product, GÜVERCİN. For this purpose, we examined the details of our design. According to the inspection on our initial design report, we decided to reduce the workload of our core part by transferring one of the functions to our HTTP module. The function that must be done by the Apache server rather than core part is HTTP2NNTP conversion. After a quick search on the internet, we found a web module for news servers and we have decided to use it and changed our design according to this little change. After that we majored on the presentation. We decided on two members to serve the presentation. We prepared the schemas of our modules in order to express them clearly. We used PowerPoint to prepare the slides and finally we served our presentation in the classroom.
