

THE CODEFATHER INC.

WEEKLY REPORT

10

This week, we made some research about “support vector machine” and “hidden markov model” which are the most helpful and usable learning and classification mechanisms for our pattern recognition module. We read a lot of books and searched web about these topics. Since understanding these topics requires high mathematical and statistical information, we did not able to get the idea and then we started to look for the sample implementations of these methods. We have found some examples but they were specific to few kinds of subjects. It seems that it is not possible to get deep into the topic in a few weeks.
