Photokan Release Notes

Version 1.0

While this release provides all of the desired functionalities except for the digital elevation model generation module, it should be noted some bugs are present in the code.

- When the hbmosaicker-plugin does not generate an output, the interface may fail to understand this and may crash.
- The image processor fails and causes a crash when an operation is performed without a project being loaded.
- The New Project Dialog does not support spaces in the comment section.
