## **CENG 492 WEEKLY REPORT**

This week we have investigated the algorithms under clusterers, classifiers and associations packages (and their subpackages), however we were not able to find an implementation which is suitable for parallelization. Every single algorithm we tried to parallelize seemed to run worse in parallelized version. For next week we will go on looking into these packages, and if we cannot find a parallelizable algorithm; if admissible, we will consider parallelizing one (or more) of these algorithms even though their parallelized versions are slower.
