CENG 491- Weekly Report 1

This week we generally focused on the parts of the project that will be mentioned in the Software Requirements Specification document, and how the diagrams will be stated in the SRS document, how we will draw them. We generally thought and made a short research on the topics: Lexer, Parser, Parser logic, UI.

We found some tools for representation of Java programs such as JavaML - An XML-based Source Code Representation for Java Programs- and analyzed how it works.

We also studied on the general Java Applet Technologies. What operations can be done within a Java Applet and JSF technology separately, and how they can be related were analyzed.
